Epstein-Barr Virus Protocols (Methods in Molecular Biology)

Epstein-Barr Virus Protocols (Methods in Molecular Biology)
The discovery of Epstein-Barr virus (EBV) by Epstein, Achong, and Barr, reported in 1964 (Lancet 1:702–703), was stimulated by Denis Burkitt's rec- nition of a novel African childhood lymphoma and his postulation that an infectious agent was involved in the tumor's etiology (Nature194:232–234, 1962). Since then, molecular and cellular biological and computational technologies have progressed by leaps and bounds. The advent of recombinant DNA technology opened the possibilities of genetic research more than most would have realized. Not only have the molecular tools permitted the analyses of viral mechanisms, but, importantly, they have formed the basis for discerning viral presence and, subsequently, viral involvement in an increasing number of diseases. Though in every field of science the search for further knowledge is likely to be a limitless phenomenon, the distinct goal in EBV research, namely, to gain sufficient insight into the viral–host interaction to be able to intercept the pathogenic process, is beginning to be realized. Epstein-Barr virus research has effectively entered the postgenomic era that began with the sequencing of the first strains, cloned in the mid to late 1980s.
